

# A Hitchhikers Guide to Structural Cryo-ET (in Warp 2.0 & friends)

Alister Burt

Dimitry Tegunov 's group  
@ Genentech

01/04/25

# quick intro

---

name: Alister Burt

how I got here:

- PhD in Grenoble 🇫🇷 with Irina Gutsche
- MRC-LMB Cambridge 🎓 with David Barford
- Genentech 🧬 with Dimitry Tegunov

## scientific interests

- cryo-ET/averaging
- **enabling** cool biological discoveries

## technical interests

- scientific visualization
- python/open source

The Scopes

# Talk Overview

---

## **structural cryo-ET**

*theory: from micrographs to maps*

## **software workflows**

*how do I actually \*do\* cryo-ET processing?*

*focus on Warp 2.0*

*sneak peak of Relay*

## **illustrated examples**

*a fun example where thinking was useful!*

# Cryo-Electron Tomography (cryo-ET)

# let's get on the same page...

multi-frame  
micrographs

dose-fractionated images  
each is 2D + time

tilt-images

individual 2D images with  
higher SNR than frames from  
multi-frame micrographs

tilt-series

stack of 2D tilt-images with  
~same field of view

tomograms

3D reconstructions  
typically made using images  
from a tilt-series

# What does a structural cryo-ET workflow look like?

# Cryo-Electron Tomography (cryo-ET)

# let's get on the same page...

multi-frame  
micrographs

dose-fractionated images  
each is 2D + time

tilt-images

individual 2D images with  
higher SNR than frames from  
multi-frame micrographs

tilt-series

stack of tilt-images with  
~same field of view

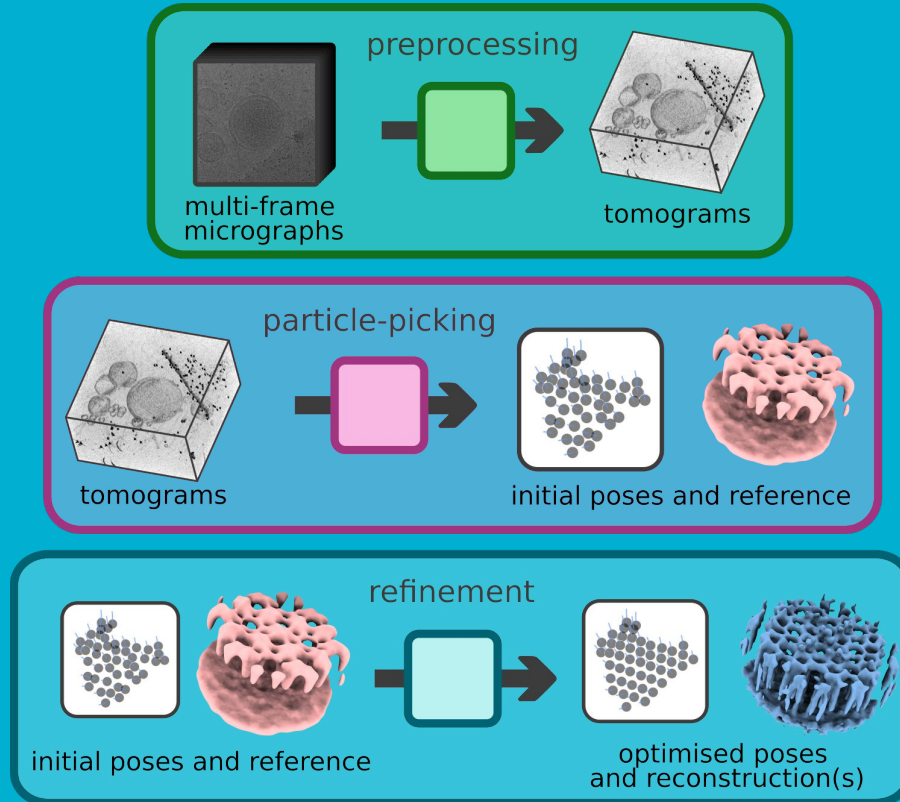

tomograms

3D reconstructions  
typically made using images  
from a tilt-series

# What does a structural cryo-ET workflow look like?

**tilt series processing is a superset of frame series processing**

# 3D reconstruction from projection images

3D object

# 3D reconstruction from projection images

3D object

3D Fourier transform  
(power spectrum)

# 3D reconstruction from projection images

3D object

3D Fourier transform  
(power spectrum)

# 3D reconstruction from projection images

central slice of  
3D Fourier transform  
(power spectrum)

# 3D reconstruction from projection images

2D projection image

central slice of  
3D Fourier transform  
(power spectrum)

# 3D reconstruction from projection images

3D object  
(real space)

central slice of  
3D Fourier transform

central slice of  
3D Fourier transform  
(power spectrum)

# 3D reconstruction from projection images

3D object  
(real space)

inverse FFT

central slices of  
3D Fourier transform  
(power spectrum)

# What is single particle analysis?

SPA is a process for determining the following parameters for each particle image

- 2D shifts
- orientations
- defocus

This allows us to build up the 3D  
Fourier transform

now let's do it for tomography

# tilt series

plus minus 60 degrees

3 degree increments

41 images

remember this is a stack of 2D images, not a 3D image

# tilt series to tomograms

reconstruction typically  
performed in real space  
because images are large

# tilt series to tomograms

localise objects of interest in 3D

# tilt series to tomograms

because we know the projection geometry  
we can find our objects of interest in 2D

# tilt series to particle tilt series

because we know the projection geometry  
we can project 3D points down to 2D

this lets us extract mini tilt series  
centered on each particle

subtomograms  $\sim$  particle tilt series  
(but it's easier to deal with the CTF properly on 2D data)

3D reconstruction  
from particle tilt series

particle tilt image FTs inserted as  
central slices  
(power spectrum)

# 3D reconstruction from particle tilt series

each particle contributes 41 central slices to the 3D FT

# What is 'subtomogram averaging'?

STA is a process for determining the following parameters for each particle tilt series

- 3D shifts
- orientations
- defocus

This allows us to build up the 3D  
Fourier transform

# What is single particle analysis?

SPA is a process for determining the following parameters for each particle image

- 2D shifts
- orientations
- defocus

This allows us to build up the 3D  
Fourier transform

tilt series processing is a superset of frame  
series processing

I hope I've convinced you

the CTF in tomograms

# CTF is changed a lot by defocus

1μm defocus  
2 Å/px

2μm defocus  
2 Å/px

# sample thickness matters

# sample thickness matters

# sample thickness matters

beam direction

# Software Workflows

# the patchwork of cryo-ET software

Ca. 2018

Kendra Leigh &  
Misha Kurdryashev

# things are improving...

---

- Warp + M
- RELION 5
- STOPGAP
- EMAN
- Dynamo
- IMOD/PEET
- nextpyp
- scipion

# things are improving...

---

- Warp + M
- RELION 5
- STOPGAP
- EMAN
- Dynamo
- IMOD/PEET
- nextpyp
- scipion

trend is towards 'complete pipelines'...

- is that what we want?
- is that realistic?

tomography (and tomography projects) are,  
by definition, complicated...

if they aren't you should probably be doing single particle

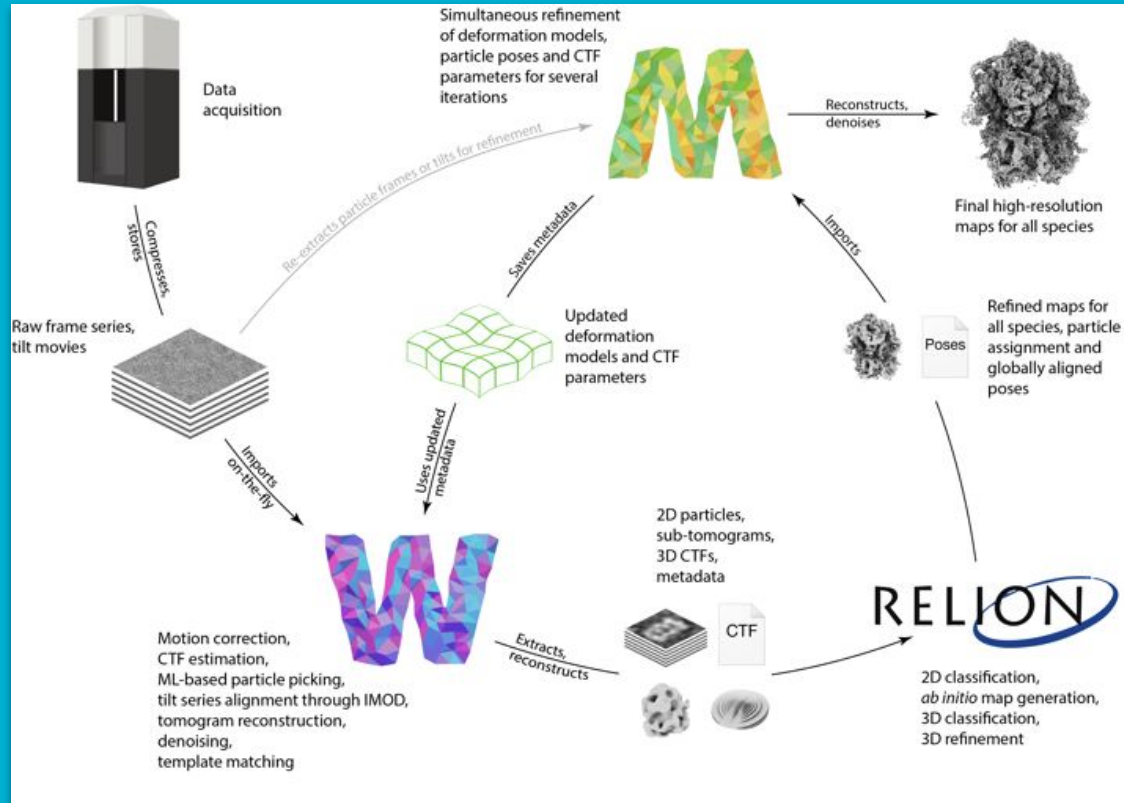

tomography (and tomography projects) are,  
by definition, complicated...

if they aren't you should probably be doing single particle

one software package is unlikely to solve \*all\* of your problems

# the Warp + M workflow

# Warp/M had a great GUI

Raw Data

SAVE SETTINGS LOAD SETTINGS

Input

Input: G:\vpp\libox\10153\upload\...\*.tif

Pixel XY: 0.5450/0.5450 Å,  $\angle$  0.0 °

Bin: 1.00x (1.0900 Å/px)

Dose: 1.00 e/Å<sup>2</sup>/frame

Preprocessing

☒ Correct gain using: G:\vpp\libox\10150\gain\_trans\_flip.mrc

☒ CTF

Window: 512 px Range: 0.10–0.65 Ny ☐ Use Movie Sum

Voltage: 300 kV Cc: 2.70 mm Cc: 2.70 mm

Amplitude: 0.10 Ill. Aperture: 30 µrad ΔE: 0.70 eV

Defocus: 0.3–4.0 µm ☒ Phase Shift ☐ Model Ice Ring

☒ Motion

Consider 0.04–0.25 Ny, weight with B = -600 Å<sup>2</sup>

Models

Defocus: 5 × 5 × 1 Motion: 5 × 5 × 20

☐ Pick Particles

Use BoxNet2Mask\_20180531

Expect 260 Å, >95% particles; use scores above 0.70

Maintain a minimum distance of 20 Å from ⚙

☒ Extract 360 px boxes, 1.0900 Å/px, ☒ invert, ☒ normalize

Output

Skip first 2, last 0 frames,

☐ Average

☐ Deconvolved average (strength = 1.00, falloff = 1.00)

☐ Aligned stack, collapse every 1 frames

Overview Fourier Space Real Space

EXPORT MICROGRAPH LIST ADJUST PARTICLE DEFOCUS EXPORT PARTICLES IMPORT PARTICLE COORDINATES MATCH TEMPLATE EXPORT BOXNET SAMPLES

Processing Status

90 222 3

Astigmatism (use up to 3.0 σ)

Defocus (use 0.35–6.00 µm)

Phase shift (use 0.00–1.00 π)

Estimated resolution (use better than 4.9 Å)

Average motion per frame in first 1/4 (use up to 1.5 Å)

Number of particles in BoxNet2Mask\_20180514: 20510 overall, 15158 good (use at least 1)

(use up to 10 %)

Overview

Desktop Warp

Quick Start: Frame Series

Quick Start: Tilt Series

Desktop M

Quick Start: M

WarpTools

Installation

Quick Start: Frame Series

Quick Start: Tilt Series

```
--out_averages \  
--out_average_halves
```

Motion corrected averages will be written out to the `warp_frameseries/average` directory. Motion and CTF related metadata will be written into XML files, one per frame series, in the `warp_frameseries` directory.

 **Tip**

Algorithms in WarpTools were written for GPUs with ~16GB memory.

If you're lucky enough to access to bigger cards, try running multiple worker processes per GPU. We typically use `--perdevice 4` on A100 cards with 80GB memory.

Parameters explained

Grids

The `--m_grid 1x1x3` and `--c_grid 2x2x1` parameters define the resolution (`XxYxT`) of motion and CTF models that will be estimated.

When processing tilt series data we typically recommend `1x1xNFrames` for motion grids due to the low amount of signal available per tilt and `2x2x1` for CTF grids to enable checking that defocus varies as expected across the tilt axis.

CTF Parameters

- `--c_range_max` is the maximum spatial resolution of information used for fitting in Å
- `--c_defocus_max` is the maximum allowed defocus value

`--c_use_sum` controls whether CTF estimation use the power spectrum from the motion corrected average or the sum of per-frame power spectra for estimation. Estimating from the motion corrected average can be useful in the absence of an energy filter, or generally when per frame signal is low.
